

How the data DOCKET collects will be used

DOCKET runs sealed-bid tenders, reverse auctions and the vendor register for Eat'n'Go, and mirrors the post-award ledger from Dynamics NAV. Every screen writes something down. This document lists what is written down, who it is for, what decisions it feeds, and what it will deliberately never be used for.

Prepared for Procurement, Finance and Internal Audit leadership Prepared 14 September 2026

Scope All data in the DOCKET database and its exports

CONTENTS

1. What is collected

2. Uses, by the question they answer

3. Who sees which data
4. What the data is never used for

5. Reports and their cadence

6. What must be true for the numbers to hold

7. Protection, retention and the law

LIVE already built and running in DOCKET

PROPOSED a use the collected data supports but nobody has switched on yet

1. What is collected

Eight datasets. The first five are created inside DOCKET by procurement staff, evaluators, approvers and suppliers. The sixth is a copy of the finance system's ledger. The last two are about the people using the system and what they did.

DATASET	WHAT IT HOLDS	WHERE IT COMES FROM
Vendor register Supplier	About 1,400 companies: legal name, NAV/RP vendor code, category and subcategory, the register's own classification wording, contact person, email, phone, address, payment terms, compliance documents with expiry dates, registration date, verification state (unverified, verified, declined with reason, suspended with reason), exposure limit, delivery performance (on-time, quality) and rating, and which route the vendor arrived by. Bank accounts are kept only as the last four digits.	The Eat'n'Go vendor master spreadsheet, refreshed by import; self-registration; buyer entry; earned history from awarded work.

DATASET	WHAT IT HOLDS	WHERE IT COMES FROM
Tenders and auctions Tender · ProcurementRound · Clarification	Reference, title, type (RFI, RFP, RFQ, auction), category, scope, weighted criteria, line items, invited vendors, addenda and notices. Three money columns: budget ceiling, projected cost, and baseline (what was being paid before, with its source). Spend coding: department, cost centre, project, region, funding source. Lifecycle timestamps: published, deadline, opened, awarded, paused, resumed, cancelled, with every deadline change and every reason. Rounds and their own windows. Clarification questions and answers.	Procurement staff configuring and running the event; suppliers asking questions.
Bids Bid · AuctionBid · Document	Per supplier per round: total amount, line prices, technical and commercial documents, submission time, disqualification flag. Bid amounts, prices and documents are stored encrypted until the recorded opening. Every price movement in a reverse auction is kept, with its time.	Suppliers, through the vendor portal.
Evaluation and award Bid.scores · Tender.coi · award_rec · letters	Conflict-of-interest declarations, each evaluator's scores and written justification per criterion, the consensus matrix, the award recommendation with its savings basis, the approver's decision (approved or returned with comment), the award memo, and the award and regret letters issued.	Evaluators, the procurement lead, the approver.
Audit trail Event · AdminAudit	Every action on every tender: who, in what role, did what, when, with detail, hash-chained to the previous entry so edits are detectable. Separately, every administration change (roles, permissions, settings) with the actor's IP.	Written automatically by the server. Nobody can add or edit an entry by hand.
Finance mirror Contract · PurchaseOrder · GoodsReceipt · Invoice · Payment · Item · FxRate	Contracts (value at signature, current value, change orders, term, status), purchase orders, goods receipts, invoices (received, due, approved, paid dates, hold reasons, early-payment discount terms), payments (date, method, discount taken), item master with unit costs, and exchange rates. Each row carries the source system's own identifier and the time it was last synced.	Dynamics NAV today, Business Central when it arrives. DOCKET reads; it never writes back.
People and access Persona · Profile · AccessRole · AuthToken	Staff name, title, role, reporting line, permission grants and revocations, MFA enrollment, active sessions. Supplier logins and which register record they are attached to.	Team invitations, the administration console, self-service security settings.
Notifications and sign-in Notification · FailedLogin	Every in-app notice and whether it was emailed and read. Failed sign-in attempts by username and time.	Generated by the system.

2. Uses, by the question they answer

Data is only worth collecting if somebody makes a decision with it. Each use below is stated as the question a real person at Eat'n'Go asks, then what DOCKET does with the data to answer it.

Running a fair competition LIVE

"Can we defend how this award was decided?"

The operational use, and the reason everything else exists. Tender configuration, invitations, sealed bids, blind scores, COI declarations and approvals are the working record of each event. Because the record is complete and time-stamped, the per-tender compliance report can be generated on demand rather than assembled after a complaint.

- Sealed bids and blind scoring stop early information reaching anyone who could act on it.
- The approval matrix routes any tender at or above the CFO's threshold for sign-off, and records that it did.
- Award and regret letters go to every bidder from the same record, so nobody is told a different story.

Uses: tenders, bids, evaluation and award, audit trail.

Measuring savings honestly LIVE

"How much did procurement save this quarter, and against what?"

Three savings figures are computed and shown side by side, never summed, because they answer different questions.

- **Negotiated saving** is award against the recorded prior price. This is the figure that survives an audit.
- **Saving against budget** is award against the ceiling set beforehand. It grades the estimate as much as the buying.
- **Cost avoidance** is award against the median bid received. Real money, but a counterfactual.

Where no prior price was recorded, the finance mirror is searched for earlier contracts in the same category, annualised against their own term, and offered to the operator as a proposed baseline with the contracts it came from. Only what the operator was shown gets adopted.

Uses: tender money columns, bids, contracts.

Seeing where the money goes LIVE

"What did the Lagos stores spend on packaging last year, and through which vendors?"

Awarded and contracted spend is sliced by department, category, project, supplier, region, funding source and cost centre. The dimensions are configuration, so opening a new region needs no software change. Spend with no coding is reported as its own line rather than folded

into "Other", so a coding gap stays visible until somebody closes it.

Uses: tender spend coding, contracts, purchase orders.

Knowing which vendors to invite LIVE PROPOSED

"Who should be on the shortlist for the next cold-chain tender?"

The register's category, subcategory, verification state, compliance-document expiry and delivery record already drive the invitation screen and the vendor scorecards. Each vendor's win/loss record across tenders is kept.

Proposed: a quarterly vendor review built from the same fields. Vendors with lapsed documents, a falling on-time rate, or no bid in the last four invitations get flagged for a conversation or removal, and vendors who bid competitively but never win get flagged as under-used. Today the data is there; the review is not scheduled.

Uses: vendor register, bids, award history, goods receipts.

Catching what should not happen LIVE

"Is anything in this portfolio a problem we have not been told about?"

Two automatic scans read the data on a schedule and raise a notification once per finding.

- **Procurement anomalies:** single-bidder awards, winner concentration in a category, awards landing suspiciously close to the budget ceiling, abnormally low bids.
- **Finance exceptions:** contract over budget, contract expiring or expired, vendor over exposure limit, payment overdue, duplicate invoice (by reference, or same amount same day), missing approval, and a broken three-way match between order, receipt and invoice.

Only findings that need attention now notify. A note for every contract ninety days from expiry would train people to ignore the channel that also carries duplicate invoices.

Uses: tenders, bids, contracts, invoices, payments, approvals.

Watching contracts after signature LIVE

"How much of the packaging contract is left, and has its value crept?"

For each contract: value at signature, current value, invoiced, paid, remaining balance, utilisation, days to expiry, and change orders listed individually. Escalation is a subtraction from the signed value, not a claim. "Value grew ₦35m" and "value grew ₦35m across nine variations nobody batched" are different findings, and only the second names the problem.

Uses: contracts, purchase orders, invoices, payments.

Paying suppliers on time, and knowing when we do not LIVE

"How long does a supplier wait to be paid, and what did late payment cost us?"

Days from invoice *receipt* to payment, which is the clock the supplier experiences, with mean, median, ageing profile and timeliness by month. Early-payment discounts are split into earned and missed. A discount that lapsed is a real loss, and it appears as one.

Uses: invoices, payments. Gated behind the payables permission.

Naming risk without inventing numbers LIVE

"Where are we exposed?"

- **Exchange rate:** on open foreign-currency commitments only, the rate struck against the rate today.
- **Vendor concentration:** share of awarded spend and open exposure per vendor against the limit set for them.
- **Vendor distress:** a list of observations only. Concentration, expired paperwork, delivery record, abnormal bidding. Never a solvency score, because DOCKET cannot see a balance sheet.

Uses: contracts, invoices, exchange rates, vendor register, bids.

Price intelligence LIVE PROPOSED

"What is a fair price for a 40ft reefer trip to Abuja right now?"

Line-item prices from every opened bid, the item master's unit costs and the history of prior contracts already feed the comparison sheet and the baseline proposals.

Proposed: a category price index. For recurring lines (flour, cheese, packaging, diesel, cold-chain transport) track the median awarded unit price per quarter, the spread between lowest and highest bid, and the movement against the NAV item cost. This turns each tender's line prices, which today are used once, into a market reference for the next tender and for budget setting.

Uses: bid line prices, item master, contracts, auction price movements.

Planning the next cycle

PROPOSED

"How long does a tender take here, and how good are our budgets?"

Every lifecycle timestamp is already recorded. From them:

- **Cycle time** from publication to award by tender type and category, and where the days go: bidding window, evaluation, approval wait.
- **Budget accuracy** as the gap between ceiling, projection and award, by category manager. A projection that is always 20% high is information about the projection.
- **Participation** as invitations sent against bids received, and the reasons vendors gave for not bidding, so a category with two live bidders is spotted before the tender, not after.
- **Contract renewal calendar** from contract end dates, so re-tenders are opened with enough runway.

Uses: tender timestamps, money columns, invitations, bids, contracts.

Drafting and review assistance

LIVE

"Give me a first draft, then a second opinion."

Six AI features read DOCKET data to draft text a human then edits: scope drafting from a title and category, criteria suggestion, a suggested answer to a vendor clarification, a comparison brief across opened bids, a supplier-side bid review, and portfolio insights across the tender list. Every prompt is assembled on the server. The supplier-side review never receives the buyer's budget.

Uses: tenders, opened bids, clarifications. Only with an API key configured.

3. Who sees which data

Access is by capability, not job title, and every rule is enforced by the server. The table shows the default grants. Custom roles can be given or refused any capability from the administration console, and every such change is itself recorded.

DATA	PROCUREMENT	EVALUATOR	APPROVER (CFO)	AUDITOR	SUPPLIER
Vendor register, contact and compliance	Full	Names only	Read	Read	Own record

DATA	PROCUREMENT	EVALUATOR	APPROVER (CFO)	AUDITOR	SUPPLIER
Tender scope, criteria, invitations	Full	Read	Read	Read	Invited tenders only
Budget, projection, baseline	Full	At evaluation	Read	Read	Never
Sealed bid amounts and documents	Existence only	Existence only	Existence only	Existence only	Own bid
Opened bids and line prices	Full	Read	Read	Read	Own bid; rank only in auctions
Evaluator scores	After all scored	Own scores only	Consensus	Read	Never
Award recommendation and memo	Write	—	Approve or return	Read	Own letter
Savings and spend views	Read	—	Read	Read	Never
Invoices, payments, vendor exposure	With payables grant	—	Read	Read	Never
Audit trail and integrity check	Read	—	Read	Read, verify, export	Never
Roles, permissions, settings	—	—	Approval threshold	Read	Never

Two separations matter most. A category manager can be shown savings and spend without being shown what every vendor is owed, because payables is its own permission. And "withheld" is never displayed the same way as "empty", so a reader always knows whether a blank is a gap in the data or a gap in their access.

4. What the data is never used for

These are product decisions, not settings. Changing any of them would need a code change and a conscious choice by the business.

- **Opening a sealed bid early.** Before the recorded opening, no role receives amounts, prices, documents or even document names. A database dump taken early contains ciphertext.

- **Decrypting a disqualified bidder's price.** In a two-stage tender, a bidder who fails the technical threshold has their commercial envelope returned unopened. The API, the exports and the database all honour this.
- **Adding the three savings figures together.** The product will not produce a single savings headline, because that headline cannot be defended.
- **Scoring a vendor's solvency or fraud risk.** Only observations are listed. A number there would be an accusation with arithmetic painted on it.
- **Holding bank account numbers.** DOCKET awards tenders and does not pay invoices. Only the last four digits are imported.
- **Sending the budget to a supplier-facing AI prompt,** or any supplier-facing screen.
- **Showing a competitor's price to a supplier.** In auctions a supplier sees their rank, never another bid.
- **Writing back to the finance system.** The ledger in DOCKET is a mirror. Payment runs, approvals and postings stay in NAV.
- **Rewriting history.** Renaming a vendor, a person or the workspace changes what is shown today. Audit records keep the name that was true at the time, and any edit to a past record breaks the hash chain visibly.

5. Reports and their cadence

The proposed reporting rhythm, so the data reaches a decision at the moment the decision is made rather than sitting in a dashboard. Everything in the first four rows is generated from views that already exist; the last two rows need the proposed uses in section 2.

REPORT	CONTENTS	CADENCE	AUDIENCE	
Per-tender compliance pack	Compliance report PDF, bid comparison, award memo, audit extract for the event	At every award	Approver, Internal Audit, file	LIVE
Monthly savings and spend	Three savings figures with basis named, spend by category and department, uncoded spend line	Monthly	CFO, Head of Procurement	LIVE
Exceptions digest	Open finance exceptions and procurement anomalies, worst first, with age	Weekly	Procurement, Finance ops	LIVE
Payment performance	Days to pay from receipt, ageing, missed discounts, by month	Monthly	CFO, Treasury	LIVE
Audit integrity export	Full hash-chained trail as CSV plus verification result	Quarterly and on request	Internal Audit, external auditors	LIVE

REPORT	CONTENTS	CADENCE	AUDIENCE	
Vendor performance review	Scorecards, lapsed documents, non-responders, under-used competitive bidders	Quarterly	Category managers, Supply Quality	PROPOSED
Category price index and planning	Unit price trends, budget accuracy, cycle time, renewal calendar for the next two quarters	Quarterly	Head of Procurement, FP&A	PROPOSED

6. What must be true for the numbers to hold

Most of the value above depends on four habits at the point of entry. None of them is a feature; all of them are discipline.

- 1. Record the baseline before publishing.** A tender with no prior price can only ever report the weaker kind of saving. Where the ledger knows the price, adopt the proposal; where it does not, ask the category manager for one.
- 2. Code the spend.** Department, cost centre, project, region and funding source on every tender. Uncoded spend is reported as its own line, and that line should shrink month on month.
- 3. Keep the register clean at source.** The spreadsheet is still the vendor master. Duplicates, blank categories and unparseable dates are all reported by the dry-run import; fix them there, not in DOCKET.
- 4. Watch the feed age.** Every finance view states how old the stalest NAV feed is. A payment-performance figure drawn from a two-week-old feed is a figure about two weeks ago.

One thing to decide before the proposed uses go live. The vendor performance review and the price index both rank real companies. Agree in writing who owns the thresholds (what counts as "falling on-time rate", how many missed invitations before a flag) and who reviews a flag before a vendor hears about it. The data can produce the list; it should not be the thing that acts on it.

7. Protection, retention and the law

The register holds personal data for around 1,400 companies: contact names, emails, phone numbers and tax identification numbers. That makes DOCKET a data controller's system under the Nigeria Data Protection Act 2023, and the following already applies or should be adopted.

- **Encryption at rest** for bid amounts, line prices and bid documents until opening. Key management is tied to the server secret today; dedicated key management is the next step before production.

- **Authentication:** TOTP two-factor for staff, brute-force lockout after five failures, single-use invitation and reset links, one-click revocation of all sessions.
- **The register never passes through source control.** It reaches a deployment through a private time-limited link or a mounted disk, and a broken link fails the build rather than deploying stale data.
- **Purpose limitation:** vendor contact data is used to run tenders and notify bidders. It is not exported to marketing, and the bulk-invite campaign guards against a vendor being emailed twice by two people.
- **Retention** **PROPOSED** : tender, bid, evaluation and audit records kept for the statutory audit period and any live dispute, then reviewed. Vendor records removed from the register are deleted on the next import unless a tender ever referred to them, in which case the record stays because the tender is a fact about what happened. Notification and failed-login logs can be trimmed after twelve months.
- **Subject access** **PROPOSED** : a vendor already sees and edits their own company details in the portal. A written procedure for a contact person asking what is held about them, and for correction, should sit beside it.

Prepared from the DOCKET codebase as it stands on 14 September 2026, including the README, data model, finance module and permission rules. Items marked Live are in the deployed application; items marked Proposed use data the application already collects but are not yet built or scheduled.
